B) INSTRUCTIONS

Firstly in the command prompt we will go to the destination location in which files controlb.py and topob.py are present using the **cd command.**

We need files controlb.py and topob.py in the mininet VM. So, we will be using the scp command to transfer the file to the VM.

For topob.py: **$ scp topob.py mininet@192.168.56.101:~/mininet/custom**

For controlb.py: **$ scp controlb.py mininet@192.168.56.101:~/pox/pox/forwarding**

Now on linux terminal firstly connect mininet using **ssh mininet@192.168.56.101**

To run Controller:

1. Change directory to: **$ cd pox**
2. To start the pox controller: **$ ./pox.py log.level --DEBUG forwarding.controlb**

To run Topology:

1. Open a new terminal window.
2. Change directory to: **$ cd mininet/custom**
3. To run the topology: **$ sudo python topob.py**

Now on the same window:

- **h1 ping h2**
- **h3 ping server**
- **iperf h1 server**
- **iperf h4 server**
- **pingall**

On the new terminal window to dump the output of the flow rules:

- **$ sudo ovs-ofctl dump-flows s1**
  Run this command for all the switches (s1,s2,s3,s4,cs5)
