C) INSTRUCTIONS

Firstly in the command prompt we will go to the destination location in which files controlc.py and topoc.py are present using the **cd command.**

We need files controlc.py and topoc.py in the mininet VM. So, we will be using the scp command to transfer the file to the VM.

For topoc.py: **$ scp topoc.py mininet@192.168.56.101:~/mininet/custom**

For controlc.py: **$ scp controlc.py mininet@192.168.56.101:~/pox/pox/forwarding**

Now on linux terminal firstly connect mininet using **ssh mininet@192.168.56.101**

To run Controller:

1. Change directory to: **$ cd pox**
2. To start the pox controller: **$ ./pox.py log.level --DEBUG forwarding.controlc**

To run Topology:

1. Open a new terminal window.
2. Change directory to: **$ cd mininet/custom**
3. To run the topology: **$ sudo python topoc.py**

Now on the same window:

- **pingall**
- **iperf h1 server**
- **iperf h4 server**

On the new terminal window to dump the output of the flow rules:

- **$ sudo ovs-ofctl dump-flows cs5**
